Earth is made of land and water. Large bodies of water are called oceans.

Earth has five oceans. One of them is called the Southern Ocean. It surrounds Antarctica.

This ocean is made of cold water. But many animals live there. One of them is the blue whale.

Blue whales are BIG. They are the biggest animals on Earth!

What do these big animals eat? Not other big animals! Blue whales eat tiny animals called krill.

Krill look like shrimp. They live in the ocean.

Krill eat tiny floating plants. The plants use the Sun’s energy to make their own food.

These three living things are connected. The plants make their food. Krill eat the plants. Blue whales eat the krill. This is called a food chain.

A food chain shows animals that eat each other. Can you think of other examples of food chains?
